

**Armstrong i-ceilings system has recently been enhanced with a new range of unique electronics to provide better sound dispersion and even levels of sound reproduction**

## Armstrong i-ceilings system boosts the CIE-Audio range

**CIE-AUDIO, THE SPECIALIST** sound division of the CIE-Group and the UK's leading supplier of installation audio equipment, has added a strong new brand to its portfolio, Armstrong's versatile i-ceilings system.

Armstrong World Industries is the world's

number one manufacturer of ceiling products, employing more than 18,000 staff in 87 manufacturing plants. The i-ceilings system, its most recent development, utilises NXT's flat panel speaker technology for 'invisible' loudspeaker

solutions with the added benefit of improved sound dispersion.

'The addition of the new Armstrong i-ceilings system provides CIE-Audio customers with a unique range of opportunities,' says CIE-Group marketing manager Chris Edwards. 'With over 80 per cent of the world's acoustic ceilings being Armstrong branded, the system provides an integrated solution both in new builds and retrofit installation.'

The i-ceilings system has been enhanced by a unique range of electronics, which include digital amplification and a range of digital and analogue processors. The analogue A2001 and digital D2001 DSP-based software controlled processors provide a combination of music, public address and active acoustics such as noise spectrums and uncorrelated digital noise sources for custom designed sound masking. □
